

Supplementary file for: Barrett R.T. & Hollister R.D. 2016. Arctic plants are capable of sustained responses to long-term warming. *Polar Research* 35. Correspondence: Robert T. Barrett, West Michigan Academy of Environmental Science, 4463 Leonard Street, Walker, MI 49534, USA. E-mail: robertbarrett@choiceschools.com

Supplementary Table S1. Values of each plant trait (inflorescence height, leaf length, reproductive effort and reproductive phenology) for each species arranged by site (Atqasuk Dry, Atqasuk Wet, Barrow Dry and Barrow Wet) and growth form (deciduous shrub, evergreen shrub, graminoid and forb). Shown are the average (Avg), standard deviation (SD) and number of plots for which data were collected (N) for each species at each site and year under ambient conditions (Control) and experimentally warmed conditions (Warmed). For further details see Methods.

Species by site & growth form	Year	Control			Warmed			
		Avg	SD	N	Avg	SD	N	
Inflorescence height (cm)								
Atqasuk Dry								
Evergreen shrub

Supplementary Table S2. Average snowmelt and daily summer temperature ($^{\circ}\text{C}$) for years 1994-2012 at each study site. Temperatures were recorded at screen height (S, 2 m) and canopy height (10-15 cm) over control (C) and experimentally warmed (W) plots.

Temperature differences between control and warmed plots at canopy height are also shown ($\text{W} - \text{C}$). Readings for screen height were made on one sensor only, canopy height readings were based on one to 12 plots that had sensors (when more than one plot was measured we calculated the average value to create one continuous record of hourly readings for the summer; from the one continuous reading we present the average value below).

Site	Year	Dry heath					Wet meadow				
		Snowmelt	S	C	W	W-C	Snowmelt	S	C	W	W-C
